The HTML Page, quiz.html. Look at review.txt for resources.
• First, open quiz.html and change the div tags to HTML5 semantic tags.
• What are some ways for me to include the Bootstrap CSS into this page, and what are the benefits of each?
• Does the JavaScript need to be at the bottom of this HTML page or can it be anywhere on the page, why or why not?
• How are the tag IDs in the HTML used in the JavaScript file?
• Optional: add a canvas design.

The CSS page, css/quiz.css:
• Add media queries for a smaller version of this page. The properties can be anything, for example, making the font sizes smaller.
• Where should you add the media queries in this page?
• Add an animation to something on the page (it can be an existing thing such as the checkboxes). We did animations for the button in the contact form lab.

The JavaScript page:
• Take the questions file, determine which answer is correct following what is in the existing JS, and put the code into the area for questions. choices and answers. Do the same with the questions already in the JavaScript file. The ones in the JavaScript file say "YOUR ANSWER HERE" so replace that with the real answer from the choices.
• Please follow instructions in comments on the JavaScript page. You will add code and comments.
• What can we add to this code to make it run after the page has loaded?
